Observations

- Predator/Prey interactions are prevalent in nature
  - Crab vs. gastropod
  - Protist vs. bacteria
- There is trait variation within species
  - Thickness of plant cuticula
  - Strength of gastropod shell
- Incorporating trait variation provides richer dynamics than classical Lotka-Volterra models

$$\frac{dN}{dt} = N(b - aM)$$
$$\frac{dM}{dt} = M(eaN - d)$$

Variables

- $N \equiv$ Prey Density
- $M \equiv$ Predator Density

Parameters

- $a \equiv$ Attack rate
- $b \equiv$ Prey birth rate
- $e \equiv$ Efficiency
- $d \equiv$ Predator death rate

$$\frac{dN}{dt} = N(b - aM)$$
$$\frac{dM}{dt} = M(eaN - d)$$

Variables

- $N \equiv$ Prey Density
- $M \equiv$ Predator Density

Parameters

- $a \equiv$ Attack rate $\longleftarrow$ *No variation!*
- $b \equiv$ Prey birth rate
- $e \equiv$ Efficiency
- $d \equiv$ Predator death rate

$$a(m) = \alpha \exp\left[-\frac{(m-\theta)^2}{2\tau^2}\right]$$

Variables

- $N \equiv$ Prey Density
- $M \equiv$ Predator Density
- $m \equiv$ Predator Character (Trait Value)

Parameters

- $\alpha \equiv$ Maximum attack rate
- $\theta \equiv$ Optimal trait value
- $\tau \equiv$ Specialization Constant

$$a(m) = \alpha \exp\left[-\frac{(m-\theta)^2}{2\tau^2}\right]$$

Variables

- $N \equiv$ Prey Density
- $M \equiv$ Predator Density
- $m \equiv$ Predator Character (Trait Value)

Parameters

- $\alpha \equiv$ Maximum attack rate
- $\theta \equiv$ Optimal trait value $\longleftarrow$ *No variation!*
- $\tau \equiv$ Specialization Constant

Distribution Assumptions

- Trait values are **normally distributed** over the populations

$$p(n,\overline{n}) = \frac{1}{\sqrt{2\pi\beta^2}} \exp\left[-\frac{(n-\overline{n})^2}{2\beta^2}\right]$$
$$p(m,\overline{m}) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left[-\frac{(m-\overline{m})^2}{2\sigma^2}\right]$$

Variables

- $N \equiv$ Prey Density
- $\overline{n} \equiv$ Mean Prey Character
- $M \equiv$ Predator Density
- $\overline{m} \equiv$ Mean Predator Character

Parameters

- $\beta^2 \equiv$ Prey Trait Variance
- $\sigma^2 \equiv$ Predator Trait Variance

Average Attack Rate

$$\overline{a}(\overline{m},\overline{n}) = \int_{-\infty}^{\infty}\int_{\infty}^{\infty} a(m,n)\cdot p(m,\overline{m})\cdot p(n,\overline{n})dmdn$$
$$= \frac{\alpha\tau}{\sqrt{\sigma^2+\beta^2+\tau^2}}\exp\left[-\frac{(\overline{m}-\overline{n}-\theta)^2}{2(\sigma^2+\beta^2+\tau^2)}\right]$$

Variables

- $N \equiv$ Prey Density
- $\overline{n} \equiv$ Mean Prey Character
- $M \equiv$ Predator Density
- $\overline{m} \equiv$ Mean Predator Character

Parameters

- $\beta^2 \equiv$ Prey Trait Variance
- $\sigma^2 \equiv$ Predator Trait Variance
- $\alpha \equiv$ Maximum attack rate
- $\theta \equiv$ *Optimal trait difference*
- $\tau \equiv$ Specialization Constant

Our Extension
Preliminary Results
1 × 1
1 × 2

Fitness Assumptions

- Prey experiences logistic growth in absence of predator
- Predator experiences exponential decay in absence of prey

$$Y(m,n,M,N) = r\left(1 - \frac{N}{K}\right) - Ma(m,n)$$

$$W(m,n,N) = eNa(m,n) - d$$

Variables

- $N \equiv$ Prey Density
- $n \equiv$ Prey Character
- $M \equiv$ Predator Density
- $m \equiv$ Predator Character

Parameters

- $r \equiv$ Intrinsic Prey Growth Rate
- $K \equiv$ Prey Carrying Capacity
- $d \equiv$ Predator Death Rate
- $e \equiv$ Efficiency

Average Fitness

$$\overline{Y}(\overline{m}, \overline{n}, M, N) = \int_{-\infty}^{\infty}\int_{-\infty}^{\infty} Y(m, n, M, N) \cdot p(m, \overline{m}) \cdot p(n, \overline{n}) dmdn$$
$$= r\left(1 - \frac{N}{K}\right) - M\overline{a}(\overline{m}, \overline{n})$$

$$\overline{W}(\overline{m}, \overline{n}, N) = \int_{-\infty}^{\infty}\int_{-\infty}^{\infty} W(m, n, N) \cdot p(m, \overline{m}) \cdot p(n, \overline{n}) dmdn$$
$$= eN\overline{a}(\overline{m}, \overline{n}) - d$$

Variables

- $N \equiv$ Prey Density
- $\overline{n} \equiv$ Mean Prey Character
- $M \equiv$ Predator Density
- $\overline{m} \equiv$ Mean Predator Character

Parameters

- $r \equiv$ Intrinsic Prey Growth Rate
- $K \equiv$ Prey Carrying Capacity
- $d \equiv$ Predator Death Rate
- $e \equiv$ Efficiency

Ecological Components

$$\frac{dN}{dt} = N \cdot \overline{Y}(\overline{m}, \overline{n}, M, N)$$
$$\frac{dM}{dt} = M \cdot \overline{W}(\overline{m}, \overline{n}, N)$$

Variables

- $N \equiv$ Prey Density
- $\overline{n} \equiv$ Mean Prey Character
- $M \equiv$ Predator Density
- $\overline{m} \equiv$ Mean Predator Character

Parameters

- $r \equiv$ Intrinsic Prey Growth Rate
- $K \equiv$ Prey Carrying Capacity
- $d \equiv$ Predator Death Rate
- $e \equiv$ Efficiency
