The Ecological Effects of Trait Variation in a u-Predator, v-Prey System

Sam Fleischer, Pablo Chavarria

Introduction

Motivation

Lotka-Volterra Schreiber, Bürger and Bolnick Our Extension

- Predator/Prey interactions are prevalent in nature
  - Crab vs. gastropod
  - Protist vs. bacteria
- ► There is trait variation within species
  - Thickness of plant cuticula
  - Strength of gastropod shell
- ▶ Incorporating trait variation provides richer dynamics than classical Lotka-Volterra models

The Ecological Effects of Trait Variation in a u-Predator, v-Prey System

Sam Fleischer, Pablo Chavarria

Motivation

$$rac{dN}{dt} = N(b - aM)$$
  $rac{dM}{dt} = M(eaN - d)$ 

- N ≡ Prey Density
- $ightharpoonup M \equiv \mathsf{Predator} \; \mathsf{Density}$

#### **Parameters**

- $ightharpoonup a \equiv \mathsf{Attack} \; \mathsf{rate}$
- $b \equiv Prey birth rate$
- $ightharpoonup e \equiv \text{Efficiency}$
- $ightharpoonup d \equiv \mathsf{Predator} \; \mathsf{death} \; \mathsf{rate}$
